

Specialized Security Assessments

Many organizations have made a concerted effort to understand and protect their information and data. However, infrastructure connectivity advances and behavioral issues are now presenting new vulnerabilities for many businesses. Patriot recognizes this facet of IT security and has developed a program that allows a company to evaluate these often overlooked exposures.

Wireless Security Risks—open radio frequencies providing access to systems, network attacks, data and asset exposure—not to mention theft of the device itself

Virtual Private Network Security Risks—sensitive nature of contents is a magnet for hackers, remote access often leads to full internal access, inadvertently and incorrectly configured VPNs are subject to the IDS misreading traffic

Social Engineering Security Assessment—employee confidence tricks including email, telephone and personal approaches; waste management

If you need to comply with any of the following mandates, Patriot can help:

- DIACAP/DITSCAP
- FISMA
- PCI
- HIPAA
- GLBA
- SOX
- BSA
- ISO/IEC
- State/Local Regulations
- Industry Standards

Wireless Security Assessment

Wireless technology continues to be one of the fastest growing technology implementations. The ability to move around without the burden of cables is a great benefit in today's mobile workforce. However, wireless technology also creates several security issues, one of which includes the extension of the network perimeter. Patriot's Wireless Security Assessment evaluates the risks related to your deployment (known and unknown) of wireless devices. Our goal is to enumerate wireless access points and clients, determine configuration settings and then identify and document security issues.

Virtual Private Network (VPN) Security Assessment

Organizations are increasingly realizing the benefits of allowing business partners to connect to restricted areas of the internal network—most often through the Internet. While VPN vendors have made it easier to establish connectivity between both internal and external entities, attention must be paid to the proper configuration of firewalls, network architecture and other network devices. Patriot's VPN Security Assessment audits these connections, including a review of firewall configuration, network devices, VPN architecture and policies. At the end of the assessment, you will be provided with a document that identifies issues discovered and objective recommendations for remediation.

Social Engineering Security Assessment

Social engineering is the use of fraudulent means to gain access to computer systems that are protected by passwords and/or user IDs. This trickery can be accomplished through several avenues—email, tele-

phone, fake websites, etc. Patriot's Social Engineering Assessment can mimic the activities of malicious people in order to identify where an organization may be susceptible to social engineering techniques. Patriot's service does not stop there. A key component to fighting, and defeating, social engineering attacks is the education of employees at all levels of the organization. Patriot can develop customized awareness programs for educating users on the best ways to thwart such attempts to compromise your security.

Patriot has a comprehensive set of professional services capabilities. Contact us at 301-695-7500 to learn more.

- Risk Management Practice includes services to assess an organization's risks and vulnerabilities, mitigate that risk to an acceptable level and monitor and proactively manage those risks to the organization.

- Threat Management Practice offers implementation, deployment and support of products to proactively protect against a potential security breach or attack.

- IT Management Practice provides operational support to IT organizations with implementation, deployment and support services for non-security products.

Securing Your Information in an Unsecured World
